Multimedia

Multimedia on Fedora

Once RPM Fusion is configured (see <https://rpmfusion.org/Configuration>)

Switch to full ffmpeg

Fedora ffmpeg-free works most of the time, but one will experience version mismatch from time to time. Switch to the rpmfusion provided ffmpeg build that is better supported. You will still need to follow the next section for additional codecs or plugins related to packages you might have installed.

```
sudo dnf swap ffmpeg-free ffmpeg --alloweraseing
```

There you don't need libavcodec-freeworld that is only meant to complement the ffmpeg-free package (and related libraries).

Install additional codec

This will allow the application using the gstreamer framework and other multimedia software, to play others restricted codecs:

- The following command will install the complements multimedia packages needed by gstreamer enabled applications:

```
sudo dnf update @multimedia --setopt="install_weak_deps=False" --  
exclude=PackageKit-gstreamer-plugin
```

Hardware Accelerated Codec

Intel(recent)

Using the rpmfusion-nonfree section

```
sudo dnf install intel-media-driver
```

Intel(older)

Using the rpmfusion-free section

```
sudo dnf install libva-intel-driver
```

Hardware codecs with AMD (mesa)

Using the rpmfusion-free section This is needed since Fedora 37 and later... and mainly concern AMD hardware since NVIDIA hardware with nouveau doesn't work well

```
sudo dnf swap mesa-va-drivers mesa-va-drivers-freeworld  
sudo dnf swap mesa-udpau-drivers mesa-udpau-drivers-freeworld
```

If using i686 compat libraries (for steam or alike):

```
sudo dnf swap mesa-va-drivers.i686 mesa-va-drivers-freeworld.i686  
sudo dnf swap mesa-udpau-drivers.i686 mesa-udpau-drivers-freeworld.i686
```

Hardware codecs with NVIDIA

The Nvidia proprietary driver doesn't support VA-API natively, but there is a wrapper that can bridge NVDEC/NVENC with VA-API

```
sudo dnf install libva-nvidia-driver
```

You can also install both 32bit and 64bit flavor in one command as needed.

```
sudo dnf install libva-nvidia-driver.{i686,x86_64}
```

Play a DVD

You need to have the libdvdcss package, to install libdvdcss you need enable tainted repos.

- Tainted free is dedicated for FLOSS packages where some usages might be restricted in some countries.

```
sudo dnf install rpmfusion-free-release-tainted  
sudo dnf install libdvdcss
```

Various firmwares

- Tainted nonfree is dedicated to non-FLOSS packages without a clear redistribution status by the copyright holder. But is allowed as part of hardware inter-operability between operating systems in some countries :

```
sudo dnf install rpmfusion-nonfree-release-tainted  
sudo dnf --repo=rpmfusion-nonfree-tainted install "*-firmware"
```
